Factorial of n (formula)

Analysis of Binary Search

```
int bsearch(int *A, int lo, int hi, int k) {  
    if (hi < lo) {  
        return NOT_FOUND;  
    }  
    int mid = lo + ((hi-lo)/2);  
    if (A[mid] == k) return mid;  
    if (A[mid] < k) return bsearch(A, mid+1, hi, k);  
    return bsearch(A, lo, mid-1, k);  
}
```

Base Case: $T(1) = c_0$

Recursive Case: $T(n) = T(n/2) + c_1$

Recurrence relations

- By itself, a recurrence does not describe the running time of an algorithm
 - ✓ need a **closed-form solution** (non-recursive description)
 - ✓ exact closed-form solution may not exist, or may be too difficult to find
- For most recurrences, an asymptotic solution of the form $\Theta()$ is acceptable
 - ✓ ... in the context of analysis of algorithms

How to solve recurrences?

- By **unrolling** (expanding) the recurrence 
 - ✓ a.k.a. **iteration method** or repeated substitution
- By **guessing** the answer and proving it correct **by induction**
- By using a **Recursion Tree**
- By applying the **Master Theorem**

Unrolling a Recurrence

- Keep unrolling the recurrence until you identify a general case
 - ✓ then use the base case
- Not trivial in all cases but it is helpful to build an intuition
 - ✓ may need induction to prove correctness

Unrolling the binary search recurrence

$$T(1) = c_0$$

$$T(n) = T(n/2) + c_1$$

Applying the base case

We already know $T(1)$ is equal to a constant c_0 :

$$= T(n/2^k) + kc_1$$

Example 1

```
int power(int b, int n) {  
    if (n == 0) {  
        return 1;  
    }  
    return b * power(b, n-1);  
}
```

Can you write (and solve) the recurrence?

Example 1

$$T(0) = 0$$

$$T(n) = T(n - 1) + 1$$

```
int power(int b, int n) {  
    if (n == 0) {  
        return 1;  
    }  
    return b * power(b, n-1);  
}
```

Example 2

$$T(1) = a$$

$$T(n) = 2T(n/2) + n$$

Example 3

$$T(0) = 1$$

$$T(n) = 2T(n - 1) + 1$$

Find the max (strongly unimodal)

- Running Time?

Find the max (weakly unimodal)

- Running Time?

$$\sum_{i=1}^n i = \frac{n(n+1)}{2}, \quad \sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6}, \quad \sum_{i=1}^n i^3 = \frac{n^2(n+1)^2}{4}.$$

In general:

$$\sum_{i=1}^n i^m = \frac{1}{m+1} \left[(n+1)^{m+1} - 1 - \sum_{i=1}^n ((i+1)^{m+1} - i^{m+1} - (m+1)i^m) \right]$$

$$\sum_{i=1}^{n-1} i^m = \frac{1}{m+1} \sum_{k=0}^m \binom{m+1}{k} B_k n^{m+1-k}.$$

Geometric series:

$$\sum_{i=0}^n c^i = \frac{c^{n+1} - 1}{c - 1}, \quad c \neq 1, \quad \sum_{i=0}^{\infty} c^i = \frac{1}{1 - c}, \quad \sum_{i=1}^{\infty} c^i = \frac{c}{1 - c}, \quad |c| < 1,$$

$$\sum_{i=0}^n i c^i = \frac{n c^{n+2} - (n+1) c^{n+1} + c}{(c-1)^2}, \quad c \neq 1, \quad \sum_{i=0}^{\infty} i c^i = \frac{c}{(1-c)^2}, \quad |c| < 1.$$

Harmonic series:

$$H_n = \sum_{i=1}^n \frac{1}{i}, \quad \sum_{i=1}^n i H_i = \frac{n(n+1)}{2} H_n - \frac{n(n-1)}{4}.$$

$$\sum_{i=1}^n H_i = (n+1) H_n - n, \quad \sum_{i=1}^n \binom{i}{m} H_i = \binom{n+1}{m+1} \left(H_{n+1} - \frac{1}{m+1} \right).$$
