Fall 2022

Quick notes

- Course-related communication
 - √ avoid emails please (use EdStem instead)
- Lab sessions
 - use your laptops (coding is an essential part of labs)
 - √ read lab instructions carefully
 - ✓ important to submit solutions before end of lab (attendance)

Analysis of Algorithms

Problem, algorithm and program

- Problem is a task to be performed
 - √ best thought in terms of (well-defined) inputs and outputs
 - problem definition does not impose constraints on how the problem
 is solved but often includes resource constraints
- · Algorithm is a sequence of steps followed to solve a problem
 - ✓ it must be correct and composed of a finite number of concrete steps
 - √ there can be no ambiguity
 - ✓ it must terminate
- Program is a representation of an algorithm in some programming language

Analysis of algorithms

Algorithm

"Any well-defined computational procedure that takes some value, or set of values, as input and produces some value, or set of values, as output."

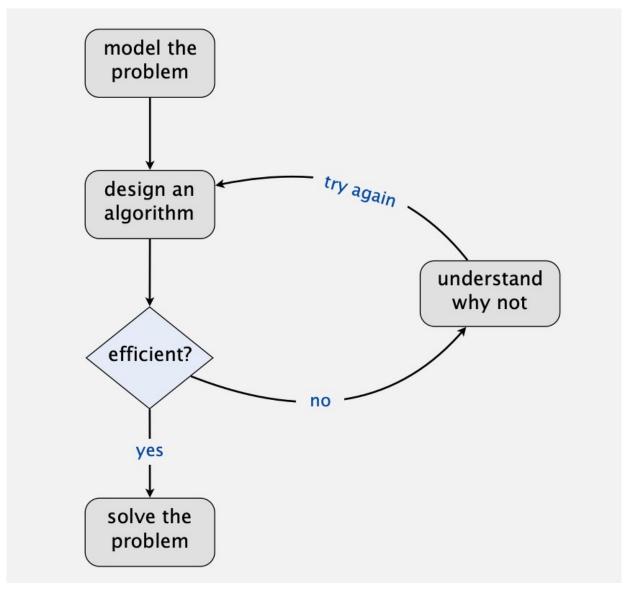

[Cormen et al., Introduction to Algorithms, 3rd. Ed.]

Amount of resources necessary to execute an algorithm?

- Time Complexity (running time)
- Space Complexity (memory)

Resources typically depend on input size

Developing a usable algorithm

[COS 226 lectures, Princeton University]

Why analysis of algorithms?

- Classify algorithms/problems
- Predict performance/resources
- Provide guarantees
- Understand underlying principles of problems
- and ...

GitHub

cloudera

Analyzing computational cost

Empirical Analysis

- Run algorithm
- Measure actual time

Mathematical Model

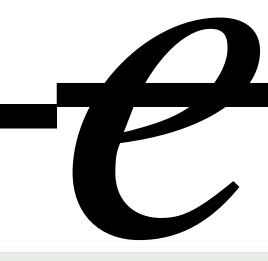

- Analyze algorithm
- Develop Model

Empirical analysis (timing)

- Implement algorithm
- Run on different input sizes
- Record actual running times
- Calculate hypothesis
- Predict and validate

Timing Algorithms

Example 1

... mathematical constant that is the base of the natural logarithm. It is approximately equal to 2.71828.

$$\lim_{n\to\infty} \left(1+\frac{1}{n}\right)^n$$

Leonhard Euler (1707–1783) was a Swiss mathematician, physicist, astronomer, geo grapher, logician and engineer who made important and influential discoveries in many branches of mathematics.

$$e = \lim_{n \to \infty} \left(1 + \frac{1}{n} \right)^n$$

$$e = \frac{1}{0!} + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \dots$$

Algorithm 1

```
long double euler1(int n) {
    long double sum = 0;
    long double fact;
    for (int i = 0; i <= n; i ++) {
        fact = 1;
        for (int j = 2; j \le i; j++) {
            fact *= j;
        sum += (1.0 / fact);
    return sum;
```

Algorithm 2

```
long double euler2(int n) {
    long double sum = 0;
    long double fact = 1;
    for (int i = 0; i <= n; i++) {
        sum += (1.0 / fact);
        fact *=(i+1);
    return sum;
```

Which is more efficient?

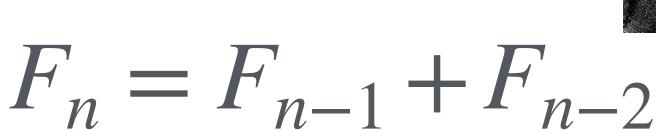

```
long double euler1(int n) {
    long double sum = 0;
    long double fact;
    for (int i = 0; i <= n; i ++) {
        fact = 1;
        for (int j = 2 ; j <= i ; j++) {
            fact *=j;
        sum += (1.0 / fact);
    return sum;
                            long double euler2(int n) {
                                long double sum = 0;
                                long double fact= 1;
                                for (inti= 0 ; i<=n ; i++)</pre>
                                    sum += (1.0/fact);
                                    fact *= (i+1);
                                return sum;
```

Example 2

$$F_0 = 0$$

$$F_1 = 1$$

$$F_n = F_{n-1} + F_{n-2}$$

0112358132134...

Recursive

```
uint64_t fibR(uint16_t n) {
    if (n < 2) {
        return n;
    } else {
        return fibR(n-1) + fibR(n-2);
    }
}</pre>
```

Iterative

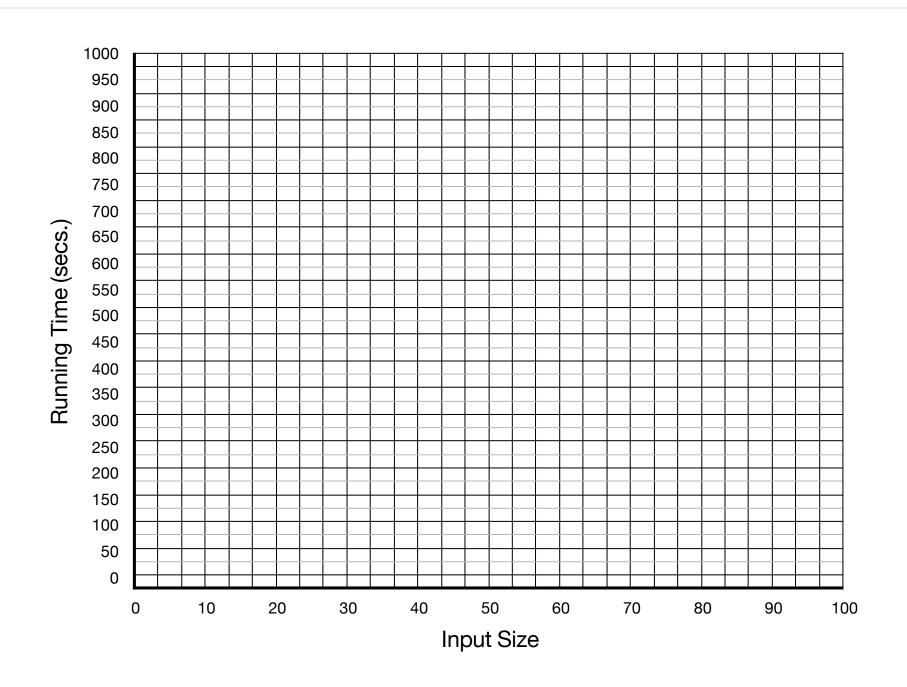

```
uint64 t fibI(uint16 t n) {
    uint64_t sum;
    uint64_t prev[] = \{0, 1\};
    if (n < 2) {
        return n;
    for (uint16_t i = 2 ; i <= n ; i++ ) {
        sum = prev[0] + prev[1];
        prev[0] = prev[1];
        prev[1] = sum;
    return sum;
```

Timing ...

```
void time_func(uint16_t n, const char *name) {
    uint64 t val;
    Clock::time_point tic, toc;
    if (! strcmp(name, "Iter")) {
        tic = Clock::now();
        val = fib iter(n);
        toc = Clock::now();
    if (! strcmp(name, "Rec")) {
        tic = Clock::now():
        val = fib rec(n);
        toc = Clock::now();
    std::cout << name << " fib(" << n << "):\t" << std::fixed << std::setprecision(4)</pre>
<< Seconds(toc-tic).count() << " sec.\t0utput: " << val << std::endl;</pre>
int main(int argc, char **argv) {
    if (argc != 3) {
        std::cout << "Usage: ./fib <n> <alg>\n";
        std::cout << "\t<n>\tn-th term to be calculated\n";
        std::cout << "\t<alg>\talgorithm to be used (Rec or Iter)\n";
        return 0:
    uint16 t n = (uint16 t)
               atoi(argv[1]);
    time func(n, argv[2]);
```

```
Iter fib(1):
                             Output: 1
                                                                  Rec fib(1):
                                                                                                Output: 1
              0.0000 sec.
                                                                                 0.0000 sec.

```

Hypothesis

Limitations of empirical analysis

- Requires implementing several algorithms for the same problem
 - √ may be difficult and time consuming
 - √ implementation details also play a role (one particular algorithm may be "better written")
- Requires extensive testing
 - √ time consuming
 - ✓ choice of test cases might favor one of the algorithms
- Variations in HW, SW, and OS affect analysis
